OPIOIDS AND THE OVERDOSE EPIDEMIC

America is facing a serious health crisis involving opioid drugs. On average, 3,900 people begin using prescription opioid painkillers for nonmedical use every day, greatly increasing each person’s risk for addiction and overdose. Deaths involving opioid overdoses have more than quadrupled since 1999. The article “Opioids and the Overdose Epidemic” helps to show the extent of the crisis as well as what is causing it. The article also explains that while prescription opioid pain medications can play an important role in a person’s medical care, they need to be used with extreme caution. Included is advice on how students can keep themselves and loved ones safe.

Critical-Thinking Questions:
1) An epidemic is when a disease or health-related event or behavior happens in a community at far greater rates than would normally be expected. What evidence in the article shows that the United States is facing an opioid overdose epidemic? (Answers may include that more people died from drug overdoses in 2015 than in any other year on record; heroin use and overdoses have increased across the country; the number of people dying from opioid drugs today is more than four times the number who died in 1999.)

2) What are some ways to help control the opioid overdose epidemic? Support your answer with information from the article. (Answers may include to make sure people only take drugs supplied by a doctor or pharmacy; if a doctor prescribes a prescription painkiller, ask if there are safer options; never share prescription drugs; make medications such as naloxone readily available so that if a person overdoses, he or she can quickly get lifesaving help; increase education about opioids so people better understand the risks.)

3) Nearly all people who use heroin also use at least one other drug. What impact can that have on overdose rates? Look in “Safety Tips” for the answer. (It may lead to higher overdose rates because mixing opioids with other drugs increases the risk for overdose.)

4) What is one piece of advice that can help people stay safe if they are prescribed opioid pain medications? (Answers may include to talk with their doctor to see if there are safer alternatives; take the medications only as prescribed; seek help if they begin taking opioids for nonmedical reasons; never mix opioids with alcohol or other drugs; don’t share prescriptions with other people; only take medications supplied by a doctor or pharmacy.)

Writing Prompts:
• Grades 6–8: What is one way people can misuse prescription opioid pain medications? What are some possible consequences of this?
• Grades 9–10: Explain one factor that may have led to an increase in the number of opioid overdoses in America.
• Grades 11–12: Why do you think heroin use is increasing across America? Support your answer with evidence from the text.

Tiered Vocabulary Tools:
Visit scholastic.com/headsup/opioidepidemic -vocabulary for a tiered vocabulary list to support this article.

Student Work Sheet:
The skills work sheet on the reverse side has students analyze graphs and combine the information with what they learned in the article to answer critical-thinking questions.

Answer Key: 1. The graph also includes the number of heroin overdose deaths from 1999–2015. 2. Roughly 12,000. 3. Answers may include that more people have started using heroin over time and that heroin potency has increased, making overdoses more likely. 4. The increase in the number of drug overdose deaths due to opioids is more than half the total number of drug overdose deaths. 5. Answers may include that the number of opioid prescriptions has increased, and with more people using the drugs there is more chance of misuse; some people who become addicted to opioid painkillers are turning to heroin, which is cheaper and often easier to obtain than prescription opioids; there has been an increase in the production and use of illegal fentanyl—a very powerful opioid that can cause overdoses. 6. Answers may vary but should include the evidence that naloxone can prevent death in opioid overdose if it is given soon enough. If ordinary people have access to it, they may be able to get it to an overdose victim quickly and save the person’s life.

Opioids in America: Alarming Trends

Statistics show that opioid overdose is a national health emergency. In 2015, 3.8 million Americans reported that they had misused prescription painkillers in the last month. Misusing these powerful drugs greatly increases a person's risk for overdose. Heroin use has also increased dramatically. Complete the activity below to analyze statistics of this crisis.

Directions: Study the graph below, which has been modified from the graph shown in the article “Opioids and the Overdose Epidemic.” Use the information in both graphs and in the article to answer the questions that follow.

1. How is the graph above different from the graph in the article?

2. According to the graph above, roughly how many deaths in 2015 were due to heroin?

3. Name one factor that may have impacted the change in heroin overdose deaths over time.

4. What evidence is there that the recent increase in drug overdoses is due mainly to opioids?

5. What is one possible reason that the number of drug overdoses related to opioids has increased in recent years?

6. Naloxone is a drug that medical professionals use to reverse the overdose effects of opioids. Do you think naloxone should be available for everyone to use? Explain your answer.
