A Dangerous Mix

Many teens regularly take medications and over-the-counter drugs. But they may not know that mixing substances can cause unexpected and potentially dangerous effects. Those risks are even greater when alcohol and illicit drugs are involved. By sharing the student article “A Dangerous Mix,” teaching the lesson, and handing out the activity sheet, you will help students be smart about medicine safety.

Critical-Thinking Questions

1. What is an active ingredient? Where can it be found? Give an example of an active ingredient. (An active ingredient is the part of a drug that has an effect on the brain or body such as causing alertness or slowing breathing. Active ingredients can be found in drugs and alcohol, over-the-counter and prescriptions medications, and even natural substances like food, vitamins, and herbal supplements. Examples may include caffeine, decongestants, stimulants in ADHD medications, etc.)

2. Explain why it is important to check the ingredients in any over-the-counter medications before taking them. (Answers may include that many over-the-counter medications contain the same active ingredients. Mixing these medications may cause you to take too much of a chemical, which may be harmful to your body.)

3. Why might someone who mixes alcohol and drugs end up in the emergency room? Use evidence to support your answer. (Alcohol increases the effects of many drugs. This can cause dangerous complications that may impair a person’s breathing, such as with sedatives or opioids, or dangerously increase a person’s heart rate, such as with stimulants like cocaine and methamphetamine.)

Writing Prompts

Grades 6–8 Why is it important to tell your doctor about any vitamins or herbal supplements you are taking?

Grades 9–10 Describe how the effect of a medication may change if it is mixed with another substance. Give an example.

Grades 11–12 Explain why mixing drugs and alcohol can increase your risk of death.

Paired Reading

“Non-Addictive Drugs: Are They Always Safe?” (teens.drugabuse.gov/blog/post/non-addictive-drugs-are-they-always-safe) This paired text describes why even over-the-counter medications should be used with caution.

Writing Prompt Explain why it is important to follow directions on an OTC medication. Describe two possible risks if you misuse the drug. Have students use text evidence from “Non-Addictive Drugs: Are They Always Safe?” and “A Dangerous Mix” to support their answers.

Activity Sheet Answers

1. The active ingredient in the medication is chlorpheniramine maleate.
2. Assuming an age of 12 and up: You can take a maximum of 12 pills per 24 hours.
3. Answers may include that a person shouldn’t drive a vehicle when taking this medication because the medication can cause the person to be drowsy.
4. Alcohol, sedatives, and tranquillizers.
5. A sedative is a substance that slows breathing and heart rate and causes drowsiness. This is similar to the medication’s side effects. When the substances are combined, the effects could be amplified, causing the person’s breathing to slow too much. It could also result in other side effects. This is also true for alcohol, which can amplify the effects of medications.

Subject Areas

• Science Literacy
• English Language Arts
• Health/Life Skills

Standards

CCSS
RST.6-8.1 / RST.9-10.1 • Cite specific textual evidence to support analysis of science and technical texts
W.6-8.1 / W.9-10.1 • Write arguments to support claims, using valid reasoning and relevant and sufficient evidence

NGSS Practices
• Obtaining, evaluating, and communicating information/engaging in argument from evidence

NSES
• Personal health

NCSS
• 8. Science, technology, and society

NIH National Institute on Drug Abuse
**Drug Facts**

**Active Ingredient (in each tablet)**
Chlorpheniramine maleate 2 mg

**Purpose**
Antihistamine

**Uses**
- temporarily relieves symptoms due to hay fever or other upper respiratory allergies:
  - sneezing
  - runny nose
  - itchy, watery eyes
  - itchy throat

**Warnings**
- Ask a doctor before use if you have:
  - glaucoma
  - a breathing problem such as emphysema or chronic bronchitis
  - trouble urinating due to an enlarged prostate gland
- Ask a doctor or pharmacist before use if you are taking tranquilizers or sedatives.
- When using this product:
  - you may get drowsy
  - avoid alcoholic drinks
  - alcohol, sedatives, and tranquilizers may increase drowsiness
  - be careful when driving a motor vehicle or operating machinery
  - excitability may occur, especially in children
- If pregnant or breast-feeding, ask a health professional before use.
- Keep out of reach of children. In case of overdose, get medical help or contact a Poison Control Center right away.

**Directions**
- adults and children 12 years and over: take 2 tablets every 4 to 6 hours; not more than 12 tablets in 24 hours
- children 6 years to under 12 years: take 1 tablet every 4 to 6 hours; not more than 6 tablets in 24 hours
- children under 6 years: ask a doctor

**Other information**
- store at 20-25° C (68-77° F)
- protect from excessive moisture

**Inactive ingredients**
- D&C yellow no. 10, lactose, magnesium stearate, microcrystalline cellulose, pregelatinized starch

---

**Read the Label!**

Read the label from an allergy and cold medication below. Answer the questions that follow.

Answer these questions on a separate sheet of paper as necessary.

1. What is the active ingredient in the medication?
2. What is the maximum number of pills someone your age can take in 24 hours?
3. Name an activity that should be avoided while taking this medicine. Explain why.
4. Which substances should not be taken with the medication?
5. Reread the sidebar “Drugs and Alcohol: A Toxic Mix” to understand the effect of a sedative on the body. Explain why a sedative should not be taken with this medication. Include evidence from the label and the article to support your answer.
